

My network isn't working on virt-manager on MX23. I want to completely uninstall everything that has to do with virt-manager including configuration files and then reinstall it from scratch. How do I do that. Give me a step by step procedure.

Answer

To completely uninstall virt-manager and related components on MX23, then reinstall from scratch, follow these steps:

1. Uninstall virt-manager and related packages:

bash

```
sudo apt-get remove --purge virt-manager libvirt-clients libvirt-daemon-system qemu-kvm
```

2. Remove any remaining configuration files:

bash

```
sudo rm -rf ~/.config/libvirt
sudo rm -rf /etc/libvirt
sudo rm -rf /var/lib/libvirt
```

3. Remove any remaining KVM-related files:

bash

```
sudo rm -rf /etc/kvm
sudo rm -f /etc/udev/rules.d/45-kvm.rules
```

```

9. Reboot your system to ensure all changes take effect:

```

After rebooting, launch virt-manager and check if the network issues are resolved. If problems persist, you may need to configure your network settings within virt-manager or troubleshoot your system's network configuration   .
